ION CHROMATOGRAPHY FLOW DIAGRAM

Ion exchange chromatography is a separation technology. The dissociatable ions on ion exchange resin exchange reversibly with the solute ions with the same charge in mobile phase. Ions are separated because of their difference in affinity to ions exchangers. So ion chromatograph is generally applicable to the separation and detection of hydrophilic anions and cations.

After the sample is injected, the ions to be analyzed are exchanged with dissociatable ions on the ion exchange resin at first (i.e. retained on the analytical column). When NaOH solution is used as eluent to analyze F^-, Cl^- and SO_4^{2-} in the sample, the ions retained on the analytical column are replaced by OH^- in the eluent, and the ions with weak affinity to the resin are eluted firstly. This is the separation process of ion chromatography. The eluent is suppressed by a chemical suppressor which can reduce the background conductance of the eluent. Then the ions to be analyzed can be measured accurately when it entered into the conductivity cell, and the detection signal can be outputted.

Our company now has four series of ion chromatograph: desktop IC, portable IC , on-line IC and customized IC.

The new D-series desktop IC has been greatly improved in instrument stability, intelligence, convenience, functional diversity, and play an important role in the detection of common anions, cations and trace ions.

Portable IC can meet the needs of rapid on-site detection of unexpected events. It not only keeps the accuracy of laboratory IC, but also makes up for the application defects of laboratory IC with the characteristics of portability, on-site and rapid detection.

On-line IC perfectly realize on-line pretreatment, automatic sampling, automatic data processing and other functions, which can continuously detect atmospheric and water quality. On-line combustion IC system provides a simple and reliable way for on-line detection of halogen and sulfur in solid and liquid samples,which greatly expands the application field of IC.

Customized IC is to upgrade the original instruments according to customer requirements.

SHINE IC products are widely used in many industries, such as environmental protection, hydrogeology, petroleum, chemical industry, food, pharmacy, health, epidemic prevention, electronics, electricity and scientific research.

SH-CC-9	4.6*250	MSA system;It is sensitive to the change of eluent and is suitable for the analysis of sodium ammonium samples with high concentration difference ratio. It can complete the rapid separation of conventional cations and various organic amines.

MAIN CORE COMPONENTS

Suppressor

Suppressor produces H^+ and OH^- through electrolysis of water at the electrode, and under the combined action of electric field and ion exchange membrane,can realizes the directional migration and exchange of ions. It reduces the background conductance, improves the sensitivity of ions to be measured, and makes the "counter ion" in the sample enter the waste liquid.

Amperometric Detector

In the case of applied voltage, the amperometric detector detects the change of current caused by the redox reaction of the substance to be measured on the electrode surface. Amperometric detector is often used to analyse ions with low dissociation, which are difficult to detect with conductivity detectors and have electrical activity .

Eluent Generator

The double membrane eluent generator can produce high-purity KOH and MSA eluent by electrolysis, which saves the manual configuration time, the degassing pipe and capture column are not required, the pressure resistance can reach 30MPa, the flow path is simpler and the dead volume is smaller.At the same time, it can realize the gradient elution and separation operation of complex samples which can not be completed by the isocratic pump, which further improves the accuracy of the analysis.
